

# SWAT!

## System-Wide Auditing Tool for SyteLine™

### THE PROBLEM: GARBAGE IN, GARBAGE OUT

Every day, users throughout your company, across all functional areas, commit transactions to the SyteLine database. But when a user enters incorrect information into SyteLine – such as incorrect unit quantities on a bill of material or labor rates on a routing – then every subsequent transaction where that incorrect information is used in a calculation will *inevitably be wrong*.

### A SUPREME WASTE OF TIME AND EFFORT

These kinds of data entry mistakes and the cascading transactional mayhem they create end up in accounting. Now someone has to 1) spend a lot of time trying to discover through tedious trial and error where the problem actually is and then 2) spend another extended period of time correcting every errant transaction. Sometimes these incorrectly calculated transactions are discovered long after accounting periods have been closed, making the correction process that much more problematic.

### THE SOLUTION:

SWAT! The **System-Wide Auditing Tool** for SyteLine.

Native SyteLine functionality lets you audit only certain fields within a limited set of 8 tables, which is a severe functional limitation considering that there are 1,000+ tables in the SyteLine schema.

Velocity Development Group's SWAT! (System-Wide Auditing Tool for SyteLine) gives you the power you to **create audit trails for any field within any table in the SyteLine software system**.

And when we say *any* field within any table we mean *any* field within *any* table; without limitation! *With SWAT!* you can **track and audit changes made to BOMs, User Extendable Tables (UET's), and custom or modified tables**. **SWAT!** lets you find data capture errors quickly and easily, search on and analyze that information, identify when the error was committed and who committed the error, and then take action.

#### SWAT! ENABLES YOU TO:

- Create audit trails for *any table* within your SyteLine Database
- Turn table audits on and off without time-consuming system resets
- Audit User Extended Tables (UET's) as well as tables added to the database that support custom developed functionality
- Online queries allow you to quickly analyze and audit data
- Track ALL events:
  - > The user that made the change
  - > The date and time the change was made
  - > The program that was responsible for the change
  - > The new value and the old value for every field that is changed
